

Sterility test: Negative for bacteria, yeast, and

Updated on: 3rd April 2023

CERTIFICATE OF ANALISYS

Lot#: CHM2202-SC-P3-Z

PRODUCT DESCRIPTION

Reference: HuSC Isolation date: 17th January 2022
Product: Cryopreserved Human Stellate Cells Storage conditions: -196°C using LN₂

Cellular passage: P3

Size/Quantity: > 100.000 cells

DONOR DEMOGRAPHICS

Species	Gender	Race	Age	ВМІ	Smoker	Alcohol Use	Drug Use	
Human	Male	Caucasian	78	22.21	No	No	No	
Pathology			Serological Data ¹					
Cholangiocarcinoma			Tested negative less than 3 months before surgery					

Patient informed consent was obtained. ¹The donor was serologically tested negative for following infectious diseases: HIV, Hepatitis B, Hepatitis C, and SARS-CoV-2. Donor medical history was also examined prior to accepting this donor. *For donor's medication information, please contact us.*

CHARACTERIZATION FOR HUMAN STELLATE CELLS

Post Thaw Lot information Number of viable cells/vial:	> 100.000							
Cell seeding density (cells/cm²):	5.000-8.000							
Cei	Cell morphology							

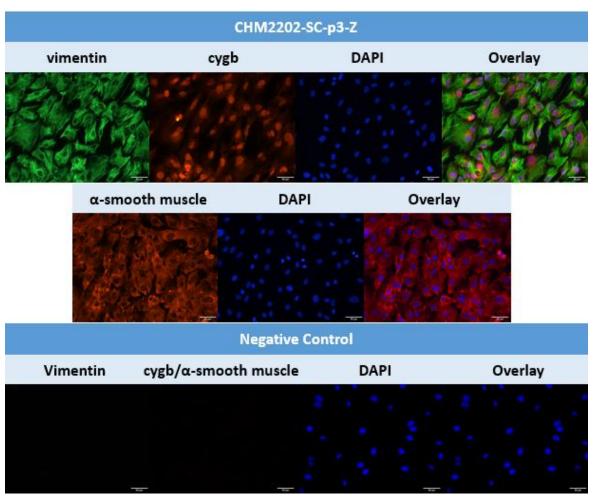

Human stellate cells were thawed and seeded according to BeCytes Biotechnologies protocol. The number of cells and viability post-thawing was assessed by using the trypan blue exclusion assay. Phase-contrast image is shown on the panel.

For basic research use only, not to be used for clinical or diagnostic applications. Products distributed by BeCytes Biotechnologies may contain human material that should be treated as potentially biohazardous.

IMMUNOFLUORESCENCE ANALYSIS

Human stellate cells are positive for vimentin, and cygb and negative for α -smooth muscle actin when they are quiescent. When they become activated, they start to express α -smooth muscle actin.

Cells were cultured on 8 well chamber slide till reach the confluence. The first panel shows green immunofluorescence for vimentin which is evident in the cell body and cytoplasmic processes in the cultured stellate cells. Red immunofluorescence for cygb is also positive. The second panel shows negative expression for α -smooth muscle actin. Both panels show blue immunofluorescence for DAPI, a cellular nuclei marker. Negative controls are showed on the bottom of each panel with all the markers used for the SC.

If you need help for an experiment, just contact us, our experts will be pleased to assist you

For basic research use only, not to be used for clinical or diagnostic applications. Products distributed by BeCytes Biotechnologies may contain human material that should be treated as potentially biohazardous.

CERTIFICATION:

The viability and performance of the human stellate cells provided depend primarily on the use of appropriate media and reagents, as well as the use of sterile plastics. Likewise, proper handling protocols must be followed. Please note that if these parameters are not carefully considered, the cellular response obtained in the assays may be lower than expected.
