CHARACTERIZATION FOR HUMAN STELLATE CELLS

Post Thaw Lot information	Result	SD	n
Number of viable cells/vial:	520.000	± 0.00	1
Viability (%):	88.7	± 0.00	1
Cell seeding density (cells/cm²):	5.000-8.000		

Cell morphology

Human stellate cells were thawed and seeded according to BeCYtes Biotechnologies protocol. The number of cells and viability post-thawing was assessed by using the trypan blue exclusion assay. Phase-contrast image 3 days after seeding is shown on the panel.

CERTIFICATION:

The viability and performance of the human stellate cells provided depend primarily on the use of appropriate media and reagents, as well as the use of sterile plastics. Likewise, proper handling protocols must be followed. Please note that if these parameters are not carefully considered, the cellular response obtained in the assays may be lower than expected.
